Apex Green Roofs, Inc. is pleased to announce their new green roof maintenance division

Somerville, MA. - Apex Green Roofs, Inc. is pleased to announce their new green roof maintenance division. After installing green roofs in the New England and Mid Atlantic regions for the past 5 years, they know the importance of maintaining a green roof. “It is true that green roofs require little maintenance, but that does not mean NO maintenance. We’ve seen the unfortunate results of improperly maintained green roofs, and having a vested interest in the industry, we want all green roofs to look their best.” says Dustin Brackney of Apex Green Roofs. “We have extensive experience with landscaping and plants and feel that putting people on the roof that are familiar with green roof plants and systems will ensure your vegetative roof is looking its best and functioning properly at all times.”

Apex Green Roofs, Inc.’s maintenance plan includes 3 steps to ensure a healthy and great looking green roof:

Inspecting Drains and Drainage Layer – Each green roof has a unique drainage system that requires a knowledgeable eye to make sure that water isn’t pooling and that it is properly draining through internal drains or scuppers.

Document Success of Green Roof – Each green roof has unique ecosystems and micro-climates where certain plants thrive and others may struggle. Apex Green Roofs, Inc. will document, with a trained eye, the plant health and will supplement appropriate plantings in troubled areas with cuttings or plugs. After every maintenance visit, they will keep the client updated on any problems that they may come across and will offer recommendations for how to resolve them. Additionally, they photo document our work and will extend the images to the client for their benefit.

Physical Maintenance – Before a green roof has completely grown in, the plants you purchased can experience competition from invasive species and weeds. Apex Green Roofs, Inc. will methodically remove all unwanted species and encourage the desirable ones with additional cuttings or plugs. They will then apply fertilizer and pre-emergent as needed and generally cater to plant/site specific needs.

"Apex Green Roofs, Inc. feels strongly that maintenance visits are critical to the success of a thriving green roof. With each visit you can expect a report on how well your green roof is functioning and pictures to document its progress." Charles Sinkler stated.

Apex Green Roofs, Inc. is offering a free estimate, for what they feel are the maintenance requirements for your vegetative roof. They are currently gearing up for spring installations and maintenance visits so call them now to set up an appointment.
